

ATNX Demo Layer — Simulated Trading UI for Demo Recording

Overview

Add a simulated trading layer on top of the existing Phase 1+2 build. This is purely frontend — no real trading, no blockchain, no real money. The purpose is to create a compelling demo recording that shows the full ATNX user journey: see something → capture it → trade on its virality → make profit.

Everything is hardcoded/mock. This is a video demo, not a production feature.

What To Build

1. Trade button on each capture card
 2. Trade modal with buy/sell UI
 3. Portfolio page showing open positions with mock PnL
 4. Entry marker on sparkline charts
 5. Simulated live chart updates (fake ticking data)
 6. Trade confirmation animations
-

Part 1: Trade Button on Capture Cards

Add a button to each existing capture card:

```
| MEME Chainsaw Man                ↘ FALLING 426 |
| [sparkline chart]                |
| "A video about Chainsaw Man meme culture..." |
| SOURCE: youtube.com CAPTURED: 3m ago          |
| ▶ Detected metrics ▶ Raw text                |
|                                              |
|                                     [ 🔥 Trade This ] |
```

- Button text: "Trade This" with a fire emoji or chart icon
- Style: ATNX green border, transparent background, hover fills green
- Positioned bottom-right of the card

- On click: opens the Trade Modal

Part 2: Trade Modal

A modal/overlay that appears when "Trade This" is clicked. Dark themed, centered on screen.

Layout

[X]

TRADE: Chainsaw Man
Current Virality Index: 426
Trend: ↘ FALLING

[sparkline chart – larger version, ~300x100]
with current price line

Position Type:

● LONG

● SHORT

Amount (USDC):

100

Quick amounts: [\$10] [\$50] [\$100] [\$500]

Entry Index: 426
Estimated Fee: \$0.50 (0.5%)

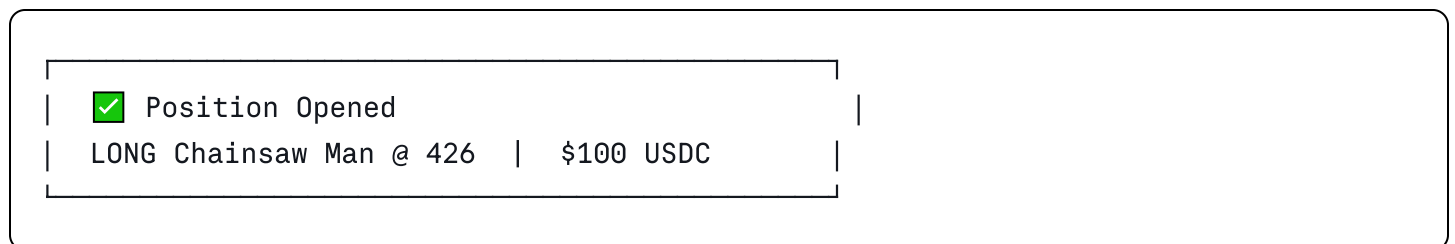

OPEN LONG POSITION – \$100

Behavior

- **Position type toggle:** LONG (green, selected by default) or SHORT (red). Only one active at a time. Clicking one deselects the other.
- **Amount input:** Text field, numbers only. Pre-filled with 100.
- **Quick amount buttons:** Clicking sets the amount field to that value.
- **Fee display:** Always 0.5% of the entered amount. Calculated live as user types.
- **Entry Index:** Shows the current virality score of this capture.
- **Submit button:** Text changes based on position type — "OPEN LONG POSITION — \$100" or "OPEN SHORT POSITION — \$100". Green background for long, red for short.
- **On submit:** Close the modal, show a confirmation toast, add the position to the mock portfolio.

Confirmation Toast

After clicking the submit button, show a brief animated toast notification at the top of the dashboard:

- Slide in from the top or fade in
- Auto-dismiss after 3 seconds
- Green border for long, red for short

Part 3: Portfolio Page

Add a new route/page: `/portfolio`

Add navigation to the dashboard header:

ATNX

Attention Exchange

Dashboard

Portfolio

[4] Captures

Portfolio Page Layout

ATNX Portfolio

Balance: \$10,000.00 USDC

Open Positions: 3

Total PnL: +\$847.20 (+8.47%)

● LONG Chainsaw Man

Entry: 310 Current: 426 Change: +37.4%
Size: \$500.00 Value: \$687.10 PnL: +\$187.10
Opened: 2h ago

chart with entry point marker ●

[Close Position]

● SHORT Say Wallahi

Entry: 460 Current: 424 Change: -7.8%
Size: \$200.00 Value: \$215.60 PnL: +\$15.60
Opened: 45m ago

[Close Position]

		● LONG	Leon Kennedy	One Liners		
		Entry: 590	Current: 585	Change: -0.8%		
		Size: \$100.00	Value: \$99.15	PnL: -\$0.85		
		Opened: 15m ago				
				[Close Position]		

Mock Portfolio Data

Store positions in React state (or localStorage for persistence across page reloads). When a user "opens" a position via the trade modal, add it to the portfolio state.

For the demo recording, also pre-populate some positions so the portfolio looks active:

```
typescript
```

```
const DEMO_POSITIONS = [
  {
    id: 'demo-1',
    type: 'long',
    name: 'Chainsaw Man',
    category: 'entertainment',
    entryIndex: 310,
    currentIndex: 426,
    size: 500,
    openedAt: new Date(Date.now() - 2 * 60 * 60 * 1000).toISOString(), // 2h ago
  },
  {
    id: 'demo-2',
    type: 'short',
    name: 'Say Wallahi',
    category: 'entertainment',
    entryIndex: 460,
    currentIndex: 424,
    size: 200,
    openedAt: new Date(Date.now() - 45 * 60 * 1000).toISOString(), // 45m ago
  },
  {
    id: 'demo-3',
    type: 'long',
    name: 'Leon Kennedy One Liners',
    category: 'entertainment',
    entryIndex: 590,
    currentIndex: 585,
    size: 100,
    openedAt: new Date(Date.now() - 15 * 60 * 1000).toISOString(), // 15m ago
  },
];
```

PnL Calculation

Simple formula for display purposes:

typescript

```
function calculatePnL(position) {
  const indexChange = position.currentIndex - position.entryIndex;
  const changePercent = (indexChange / position.entryIndex) * 100;

  // For short positions, PnL is inverted
  const direction = position.type === 'long' ? 1 : -1;
  const pnlPercent = changePercent * direction;
  const pnlAmount = position.size * (pnlPercent / 100);
  const currentValue = position.size + pnlAmount;

  return {
    pnlPercent: pnlPercent.toFixed(2),
    pnlAmount: pnlAmount.toFixed(2),
    currentValue: currentValue.toFixed(2),
    isProfit: pnlAmount >= 0,
  };
}
```

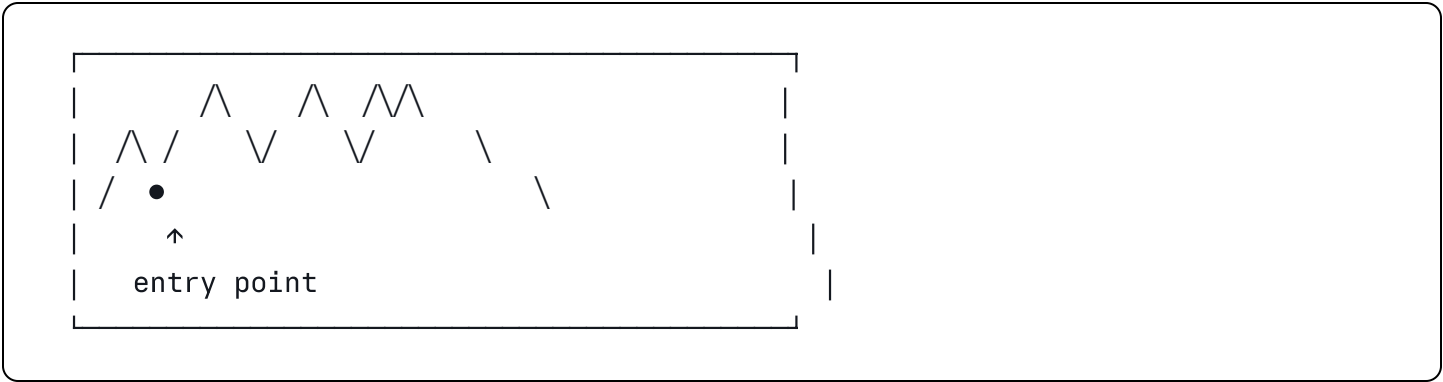

Close Position

When "Close Position" is clicked:

1. Show a brief confirmation: "Closed LONG Chainsaw Man — Profit: +\$187.10"
2. Remove the position from the list with a fade-out animation
3. Update the total PnL and balance at the top

Part 4: Entry Marker on Charts

When a position is open for a capture, show the entry point on that capture's sparkline chart in the dashboard view AND in the portfolio view.

Implementation:

- On the recharts LineChart, add a ReferenceDot at the data point closest to the entry index value
- Use a green dot for long entries, red dot for short entries
- Optional: add a horizontal ReferenceLine at the entry index level (dashed, subtle)

```
tsx

import { ReferenceDot, ReferenceLine } from 'recharts';

// Inside the LineChart:
<ReferenceLine
  y={entryIndex}
  stroke={position.type === 'long' ? '#00FF66' : '#FF0040'}
  strokeDasharray="3 3"
  strokeOpacity={0.5}
/>
<ReferenceDot
  x={entryDataPointIndex}
  y={entryIndex}
  r={4}
  fill={position.type === 'long' ? '#00FF66' : '#FF0040'}
  stroke="none"
/>
```

Part 5: Simulated Live Chart Updates

For the demo recording, make the charts appear to be updating in real time. This creates the feeling of a live market.

Fake Ticker

Add a `useFakeTicker` hook that periodically appends new data points to the trends chart data:

```
typescript
```

```
// hooks/useFakeTicker.ts

import { useState, useEffect } from 'react';

export function useFakeTicker(
  initialDataPoints: { date: string; value: number }[],
  enabled: boolean = true
) {
  const [dataPoints, setDataPoints] = useState(initialDataPoints);

  useEffect(() => {
    if (!enabled || initialDataPoints.length === 0) return;

    const interval = setInterval(() => {
      setDataPoints(prev => {
        const lastValue = prev[prev.length - 1]?.value ?? 50;

        // Random walk: small random change from last value
        // Bias slightly upward for more exciting demos
        const change = (Math.random() - 0.45) * 8;
        const newValue = Math.max(0, Math.min(100, lastValue + change));

        const newPoint = {
          date: new Date().toISOString(),
          value: Math.round(newValue),
        };

        // Keep last 168 points (7 days of hourly data), drop oldest
        const updated = [...prev, newPoint];
        if (updated.length > 168) updated.shift();

        return updated;
      });
    }, 3000); // New data point every 3 seconds for demo

    return () => clearInterval(interval);
  }, [enabled, initialDataPoints.length]);

  return dataPoints;
}
```

Enable with a toggle

Add a small hidden toggle or URL parameter to enable the fake ticker:

- `localhost:3000?demo=true` enables fake live updates
- Or a small "► Live" toggle button in the dashboard header

When enabled:

- All sparkline charts start ticking with new data points every 3 seconds
- Virality scores recalculate with each tick
- Portfolio PnL values update as scores change
- The whole dashboard feels alive and dynamic

Virality Score Live Update

As the fake ticker changes chart values, recalculate and display the updated virality score:

typescript

```
// Recalculate score from the updated (fake) data points
// Use the same calculateViralityScore function from Phase 2
// Update the score badge and PnL in real time
```

This means during the demo recording, the user can watch scores tick up and down, PnL change, and charts extend in real time. Very compelling on video.

Part 6: Close Position Profit Screen

When closing a profitable position, show a brief celebratory screen/modal:

Position Closed

Chainsaw Man — LONG

Entry: 310

Exit: 426

Change: +37.4%

Size: \$500.00

Profit: +\$187.10

[Back to Portfolio]

- Green border and accents for profitable close
- Red border for loss
- Show a simple progress/profit bar
- Auto-dismiss after 5 seconds or click to close
- Optional: confetti animation for profits over 20% (use a lightweight library like canvas-confetti or just skip it)

Navigation Structure

/	– Dashboard (capture list, sorted by virality)
/portfolio	– Portfolio (open positions, PnL)

Header navigation on both pages:

ATNX	[n] Captures
Attention Exchange	
[📊 Dashboard]	[💰 Portfolio] [▶ Live] (demo toggle)

Active page is highlighted in green. Capture count badge always visible.

State Management

For demo purposes, use React Context or simple useState at the app layout level. No need for Redux or external state management.

```
typescript

// context/DemoContext.tsx

interface Position {
  id: string;
  type: 'long' | 'short';
  name: string;
  category: string;
  entryIndex: number;
  currentIndex: number;
  size: number;
  openedAt: string;
  captureId: string; // links back to the capture
}

interface DemoState {
  positions: Position[];
  balance: number; // Starting: 10000
  isLiveMode: boolean; // Fake ticker enabled
}
```

Store in localStorage so it persists across page reloads during the recording session. Pre-populate with DEMO_POSITIONS on first load.

Implementation Priority

1. **Trade modal** — the core UI for placing a simulated trade
2. **Portfolio page** — display mock positions with PnL
3. **State management** — context/localStorage for positions and balance
4. **Navigation** — header links between dashboard and portfolio
5. **Confirmation toast** — feedback when opening a position
6. **Close position flow** — with profit/loss screen
7. **Entry markers on charts** — ReferenceDot on sparklines

8. **Fake ticker** — simulated live chart updates
 9. **Demo toggle** — URL param or button to enable live mode
 10. **Polish** — animations, transitions, colors
-

Styling Notes

- Keep all existing ATNX styling: dark background (( #0D0D1A)), green accents (( #00FF66)), monospace font
 - Profit = green (( #00FF66))
 - Loss = red (( #FF0040))
 - Neutral = gray (( #888888))
 - Modal backdrop: rgba(0, 0, 0, 0.7) with blur if possible
 - All numbers in monospace font for that terminal/exchange feel
 - Subtle animations: fade in cards, slide in toasts, pulse on score changes
-

Important Notes

- **This is NOT real trading.** No blockchain, no smart contracts, no real money. It is a UI simulation for a demo video. Make sure there is no confusion in the code — name variables and components with "mock" or "demo" prefixes where appropriate.
 - **Pre-populated data is key.** The demo will look better with some positions already open when the recording starts. Make sure DEMO_POSITIONS load on first visit.
 - **The fake ticker should be smooth.** Janky or jumpy updates look bad on video. Use CSS transitions on score numbers and smooth chart animations.
 - **Keep the trade modal simple.** Don't over-engineer with leverage, order types, slippage settings etc. Just long/short, amount, and submit. This is an MVP demo.
-

Demo Recording Script (for reference)

The intended flow for the demo video:

1. Open browser, show YouTube/Twitter with trending content
2. Press Ctrl+Shift+X, drag selection over a trending meme

3. Switch to ATNX dashboard — new entry appears with virality score
4. Click "Trade This" on the entry
5. Select LONG, enter \$500, click submit
6. Toast confirms position opened
7. Navigate to Portfolio — new position visible alongside pre-populated ones
8. Enable live mode — charts start ticking, scores updating
9. Watch PnL change in real time as virality updates
10. Close the profitable pre-populated position (Chainsaw Man)
11. Profit screen shows +37.4% gain
12. End on the dashboard with multiple active markets, live updating

Total demo time: ~60-90 seconds

Success Criteria

The build is done when:

1. ☒ Each capture card has a "Trade This" button
2. ☒ Clicking "Trade This" opens a trade modal with long/short toggle and amount input
3. ☒ Submitting a trade shows a confirmation toast and adds to portfolio
4. ☒ Portfolio page shows all open positions with calculated PnL
5. ☒ PnL is color-coded green for profit, red for loss
6. ☒ Closing a position shows a profit/loss summary screen
7. ☒ Charts show entry point markers for open positions
8. ☒ Live demo mode makes charts tick with simulated data updates
9. ☒ Virality scores and PnL update in real time during live mode
10. ☒ Navigation between Dashboard and Portfolio works smoothly
11. ☒ Pre-populated demo positions load on first visit
